**Q25. Using Shell Programming:**

**i) Read a number and find its square**

**ii) Find the biggest of three numbers**

**AIM**

To write and execute shell scripts in the Kali Linux operating system to (i) read a number and find its square and (ii) find the biggest of three numbers, and to understand the use of variables, user input, arithmetic expansion and conditional statements in shell programming.

**COMMANDS TO EXECUTE**

**First, create the script file using nano**

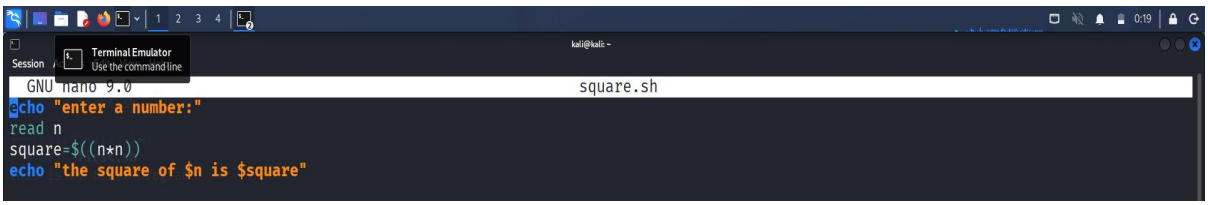

Then write the script and execute it with bash.

1. **Square of a Number**

   The script reads a number n from the user and calculates its square using the arithmetic expansion $(( )).

   **Commands:** `nano square.sh` and `bash square.sh`

**SCRIPT:**

**OUTPUT:**

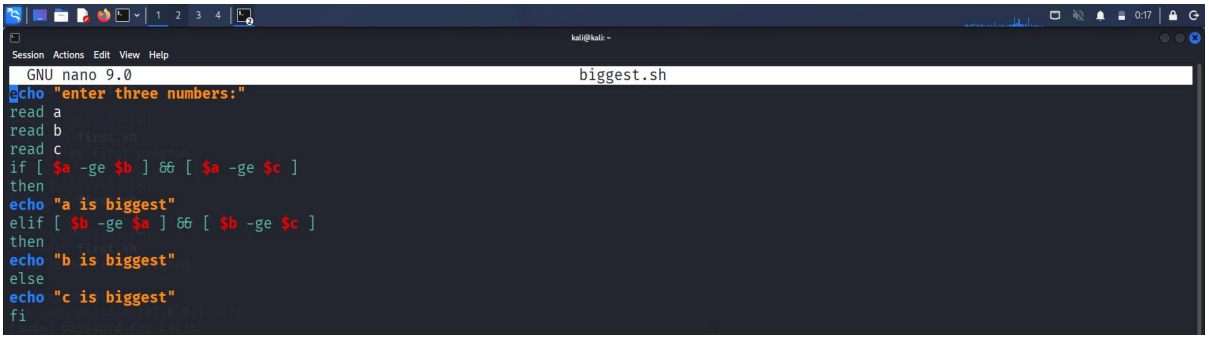

2. **Biggest of Three Numbers**

   The script reads three numbers a, b and c and compares them using if, elif and else statements to display the biggest one.

   **Commands:** `nano biggest.sh` and `bash biggest.sh`

**SCRIPT:**

**OUTPUT:**

**RESULT**

The shell scripts were successfully written and executed in Kali Linux. The first script read a number and displayed its square (for example, the square of 5 is 25 and the square of 25 is 625), and the second script compared three numbers and displayed the biggest of them using conditional statements.
